SUDMILTEG (DEC-1995) TO THE EMBL/GENBANK/DDBJ databases.
SUDMILTEG (DEC-1995) TO THE CELL RECOGNITION. APPEARS TO FUNCTION IN LEUKOCYTE-ENDOTHELIAL CELL ADHESION. INTERACTS WITH THE BETA-1
INTEGRIN VLA4 ON LEUKOCYTES, AND MEDIATES BOTH ADHESION AND SIGNAL
TRANSDUCTION. THE VCAMI/VLA4 INTERACTION MAY PLAY A
PATHOPHYSIOLOGIC ROLE BOTH IN IMMURE RESPONSES AND IN LEUKOCYTE
EMIGRATION TO SITES OF INFLAMMATION.

POSTBLELLULAR LOCATION: TYPE I MEMBRANE PROTEIN (LONG ISOFORM) OR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Terry R.W., Kwee L., Levine J.F., Labow M.A.; "Cytokine induction of an alternatively spliced murine vascular cell adhesion molecule (VCAM) mRNA encoding a glycosylphosphatidylinositol-anchored VCAM protein."; Proc. Biol. Chem. 273:234-9242(1998).

-I- FUNCTION: Immunoglobulin-like cell surface receptor for CD47. Acts as docking protein and induces translocation of PTPN6, PTPN1 and other binding partners from the cytosol to the plasma membrane. Supports adhesion of cerebellar neurons, neurite outgrowth and glial cell attachment. May play a key role in intracellular signaling during synaptogenesis and in synaptic function. Involved in the negative regulation of receptor tyrosine kinase-coupled cellular responses induced by cell adhesion, growth factors or insulin. Mediates negative regulation of phagocytosis, mast cell activation and dendritic cells and inhibits cytokine production by mature dendritic cells and inhibits cytokine production by mature dendritic cells. May play a role in the release of nitric oxide by macrophages (May similarity).

-I- SUBUNIT: Binds PTPN11 when tyrosine-phosphorylated, except in macrophages, where it primarily binds PTPN6. Binds GRB2 in vitro. Binds FGR. Binds JAK2 irrespective of its phosphorylation status and forms a stable complex. Binds FTPN6. Binds GRB2: The resulting complex recruits FYB. Binds PTX2B (By similarity).

-I- SUBCELULAR LOCATION: Type I membrane protein.

-I- TISSUE SPECIFICITY: Highly expressed in brain, spleen, lung, liver and kidney. Detected at lower levels in heart. Highly expressed in dendritic cells in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EMBL; D85183; BAA12734.1; -.

Involved in the negative regulation of function (By similarity). Involved in the negative regulation of function (By similarity). Involved in the negative regulation of function (By similarity). Involved in the negative regulation of freeptor tyrosine kinase-coupled cellular responses induced by cell adhesion, growth factors or insulin. Mediates negative regulation of phagocytosis, mast cell activation and dendritic cell activation. CD47 binding prevents maturation of immature dendritic cells and inhibits cytokine production by mature dendritic cells. SUBUNIT: Binds FTRNII when tyrosine-phosphorylated, except in macrophages, where it primarily binds FTRN6. Binds GRB2 in vitro. Binds FGR (By similarity). Binds JAX2 irrespective of its phosphorylation steatus and forms a stable complex. Binds SCAP1 and/or SCAP2. The resulting complex recruits FYB. Binds PTX2B.

"Towards a catalog of human genes and proteins: sequencing and analysis of 500 novel complete protein coding human cDNAs.";
Genome Res. 11:422-435 (2001).

-i-FUNCTION: Involved in the maintenance of nuclear organization and structural integrity. Probable anchoring protein which theters the nucleus to the cytoskeleton. Connects nuclei to the cytoskeleton by interacting with the nuclear envelope and with F-actin in the Jikuya H., Takano J., Nomura N., Kikuno R., Nagase T., Ohara O., Ninomiya K., Wagatsuma M., Kanda K., Kondo H., Yokoi T., Kodaira H., Furuya T., Takahashi M., Kikkawa E., Omura Y., Abe K., Kamihara K., Katsuta N., Sato K., Tanikawa M., Yamazaki M., Sugiyama T., Irie R., Otsuki T., Sato H., Wakamatsu A., Ishii S., Yamamoto J., Isono Y., Kawai-Hio Y., Saito K., Nishikawa T., Kimura K., Yamashita H., Matsuo K., Nakamura Y., Sekine M., Kikuchi H., Warakawa K., Kanehori K., Nakamura Y., Sekine M., Kikuchi H., Murakawa K., Kanehori K., Takahashi-Fujii A., Oshima A., Sugiyama A., Kawakami B. SUBCHLULAR LOCATION: Type IV membrane protein (Potential). The SUBCELLULAR LOCATION: Type IV membrane protein (Potential). The largest part of the protein is cytoplasmic, while its C-terminal part is associated with the nuclear envelope, most probably the outer nuclear membrane. Remains associated with the nuclear envelope during its breakdown in mitotic cells.

SIMILARITY: Belongs to the nesprin family.
SIMILARITY: Contains 1 actin-binding domain.
SIMILARITY: Contains 2 calponin-homology (CH) domair
SIMILARITY: Contains 1 Klarsicht domain.
SIMILARITY: Contains 13 leucine-rich (LRR) repeats.
SIMILARITY: Contains 9 spectrin repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Name=9; Synonyms=NUANCE-N-33;
IBOId=08WXH0-9; Sequence-VSp_007159, VSP_007160;
TISSUE SPECIFICITY: Widely expressed, with higher level in kidney, adult and fetal liver, stomach and placenta. Weakly expressed in skeletal muscle and brain. Isoform 5 is highly expressed in pancreas, skeletal muscle and heart.

DOMAIN: The Klarsicht domain mediates the nuclear envelope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AF435010; AAL33547.1; -...

INVOLVED IN NEURITE EXTENSION E REURONS VIA HETEROPHILIC AND HOMOPHILIC INTERACTIONS.
SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: PRESENT ON ALL RETINAL GANGLION CELLS (RGCS)
AND THEIR AXONS (IN EMBRYO). ABSENT FROM MATURE AXONS ALONG MOST OF THEIR LENGTH, BUT IS PRESENT ON UNW AND GROWING AXONS DERIVED FROM THE RGCS AT THE RETINAL MARGIN. REMAINS ON ADULT RGCS ONLY A CELL-CELL CONTACT SITES AND IS CONTINUOUSLY FOUND IN THE RETINAL AXON TERMINAL ARBOR LAYERS OF THE ADULT TECTUM.

SIMILARITY: Belongs to the immunoglobulin superfamily.
Ll/neurofascin/NgCAM family.
SIMILARITY: Contains 6 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 5 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           to axonin on neurons
